TITLE: About the Method of Working Out Norms for the Generalized Standardization of Machine-Tool Operations

PERIODICAL: Trud i zarabotn. plata, 1958, Nr 4, pp 25-31

ABSTRACT: A report about the conference on problems of the methods of working out norms for the generalized standardization of machine-tool operations in mechanical engineering, held by the Scientific Research Institute of Labor in May 1958. Information was given about working out generalized norms for operations on lathes, milling machines, and planers, as well as for those performed on gear cutters. Further information was given about a project of norms for turret lathes and assembly work, about the experience of working out norms for the standardization of machine-tool operations in single piece production, in small and big series, and about the fundamentals of generalized standardization and methods of making out tables for a speedier choice of the right cutting conditions. 4 tables.

TITLE: Method of obtaining infralow temperatures, based on the dissolution of He³ in He⁴

SOURCE: Zh eksper i teor fiz, v. 50, no. 6, 1966, 1445-1457

TOPIC TAGS: liquid helium, low temperature phenomenon, cryogenic liquid cooling, cryogenic refrigerator

ABSTRACT: The method described was originally proposed by London, Clarke, and Mendoza (Phys. Rev. v. 128, 1992, 1962 and earlier) and is based on the use of the latent heat of dissolution of liquid He³ in He⁴. The refrigeration cycle is produced by continuously separating the two components at a higher temperature. The heat-transfer circuit is shown in Fig. 1 and the mechanics of separating and recirculating the He³ is shown in Fig. 2. The authors review the theory of the method, describe the continuous dissolution and circulation, present thermodynamic calculations of the cooling capacity of the equipment, and present a description of the complete apparatus and of the results. A temperature of 0.1K can be maintained with a heat supply of 1800 erg/sec and with He³ circulation of 1.84×10^{-4} mole/sec. In the absence of external heat supply the temperature of the solution can be maintained at ~0.056K. If

Card 1/2

L 32723-00

ACC NR: AP6020197

the ambient conditions do not change, the temperature can be maintained constant within $\sim 0.001\text{K}$. Later experiments, based on data on the solubility of He^3 at $\sim 0.01\text{K}$ (A. C. Anderson et al. Phys. Rev. Lett. v. 16, No. 7, 1966), stimulated the construction of a larger heat exchanger, yielded temperatures down to 0.025K , and made possible a temperature of 0.1K to be maintained at 1300 erg/sec supply. The authors thank Professor V. P. Dzhelepov for an opportunity to perform the work, L. B. Perfe-

nev for participating in the first experiments, N. I. Kvirkov and F. A. Nikolayev for preparing the vital units of the apparatus, and the staff of the cryogenic laboratory of OIYaI for continuously supplying liquid helium under difficult conditions. Orig. art. has: 6 figures and 8 formulas.

TITLE: On the Problem of Selection of Optimal Conditions of Photography and Photometry of X-ray Bands (K voprosu vybora optimal'nykh usloviy s"yemki i fotometrirovaniya rentgenovskikh polos)

PERIODICAL: Sb. nauchn. rabot In-ta metallofiz. AN UkrSSR, 1957, Nr 8,
pp 209-214

ABSTRACT: A detailed analysis of factors influencing experimental data during the study of the fine structure of X-ray bands: the resolving capacity of the apparatus, the grain size of the photosensitive material, the width of the slot, and the pitch of the screw of the microphotometer. The great importance of the grain size in the photosensitive layer is indicated. In particular a background fluctuation of $\pm 2\%$ on "Agfa" film appears even at a 1000 : 1 ratio between the area of the section measured photometrically and the area of the grain in the film. The following conclusion is based on the experimental data: the resolving capacity of a spectrograph is determined by the grain size of

TITLE: The Structure of the Energy Spectrum of Electrons in Iron-Chromium Alloys (Struktura energeticheskogo spektra elektronov v zhelezo-khromistykh splavakh)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol. 121, Nr 2, pp. 264 - 267 (USSR)

ABSTRACT: The $\alpha \rightarrow \sigma$ phase transformation of Fe-Cr alloys is of high interest because of the changed structure of the crystal lattice and the modification of different physical properties occurring in connection with it. These modifications are connected with modified energetical conditions of the atom electrons of the alloy component. The investigation of the modification of the fine structure of X-ray spectral lines - caused by transitions of electrons from exterior energetic bands to the K-level - offers an insight into the character of the σ -phase, the mechanism of the $\alpha \rightarrow \sigma$ phase transition and into the physical properties. In the present paper investigations of K_{β_5} X-ray emission bands of chromium and iron in Cr-Fe

Card 1/3

The Structure of the Energy Spectrum of Electrons in Iron-Chromium Alloys

SOV/20-121-2-19/53

alloys are described. Similar investigations, namely of K-absorption spectra of the K₃-group of chromium and iron of a Fe-Cr alloy with 52,38% of iron were carried out by Kazantsev (Refs 1,2), yet the weak linear dispersion of the spectrograph applied did not permit a clear interpretation of the results. The authors of the present paper investigated Fe-Cr alloys with 35,45 and 55 % by weight of chromium; very pure Cr and Fe was obtained by electrolytical methods, the alloy was homogeneously tempered in a vacuum high-frequency furnace at 1150° for 50 hours. The transformation of the alloy from the α- into the σ-phase took place during the isothermal annealing at 650° in the course of 150 hours. The procedure adopted in the experiments was described in a previous paper (Ref 3) and is not repeated here. The results for pure Fe, pure Cr and 10 Fe-Cr alloys of different composition are given in a table. There are 2 figures, 2 tables, and 3 references, which are Soviet.

 Technical Sciences; I. M. Pavlov, and F. P. Zudin, Candidate
 of Technical Sciences.

PURPOSE: This book is intended for metallurgists concerned with
 the structural metallurgy of alloys.

COVERAGE: This is a collection of specialized studies of various

problems in the structural metallurgy of heat-resistant alloys.
 Some are concerned with theoretical principles, some with descriptions
 of new equipment and methods; others, with specific properties
 of specific materials. References to further literature on
 specified conditions are studied and reported. For details,
 see Table of Contents. The articles are accompanied by a num-
 ber of references, both Soviet and non-Soviet.

TITLE: The Structure of the Electron Energy Spectrum of Fe-Cr,
Fe-Cr-Ni Alloys

PERIODICAL: Fizika metallov i metallovedeniye, 1959, Vol 8, Nr 2,
pp 211 - 215 (USSR)

ABSTRACT: The aim of the present work was to establish characteristic
changes in the structure of the electron energy spectrum
due to the addition of nickel and iron-chromium alloys.
The following alloys were used: Fe-Cr (55% Fe),
Fe-Cr-Ni (58.4% Fe and 15.4% Ni). The nickel was electro-
lytically pure and the other components were of a "high
degree of purity". The investigation was carried out with
the aid of a quartz crystal ($R = 50$ cm) X-ray spectro-
graph (compare Ref 1) K_{β} lines of Cr, Fe and Ni (due to
transitions from the conduction band of the K-level)
together with the shortwave K_{β}''' satellite, and
 K_{β_1} lines (due to the transitions from the 3p-shell

Card1/3

The Structure of the Electron Energy Spectrum of Fe-Cr, Fe-Cr-Ni
Alloys

SOV/126-8-2-9/26

of the K levels) together with the long wave K_{β} , satellite were investigated. These lines were obtained at 1 000°C for the elements taken separately of the above alloys. The K_{β} lines for Fe and Ni were recorded in the fourth order and the Cr lines in the third order. The corresponding dispersion was 3.88 Å/mm (Cr), 2.44 Å/mm (Fe) and 3.03 Å/mm (Ni). The results obtained are shown in Tables 1 and 2. It was found that the width of CrK_{β_5} obtained for pure chromium increased with temperature. In the magnetic transition region there was a sharp increase in the width of FeK_{β_5} (to 0.9 ± 0.1 eV). The position of FeK_{β_5} remains unaltered. The $\alpha \rightarrow \gamma$ phase transformation is accompanied by a small change in the Fermi energy. The Fermi energy for the Fe-Cr alloy is $0.19 \sqrt{v/R}$ and $0.22 \sqrt{v/R}$ for the Fe-Cr-Ni alloy.

Card2/3

SOV/126-8-2-9/26

The Structure of the Electron Energy Spectrum of Fe-Cr, Fe-Cr-Ni Alloys

Alloying of chromium, nickel and iron results in sharp changes in the position of the K_{β}''' satellites of chromium iron and nickel and a rapid change in the K_{β_5} and K_{β_1}''' intensity ratios. The position of the maximum K_{β_1} remains unaltered in all cases.

There are 3 figures, 3 tables and 2 Soviet references.

TITLE: Structure of the Energy Spectrum of Electrons in Iron - Chromium Alloys (Struktura energeticheskogo spektra elektronov v zhelezo-khromistykh splavakh)

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1959, Vol 23, Nr 5, pp 573 - 577 (USSR)

ABSTRACT: Great interest is displayed for the phase transformation $\alpha \rightarrow \delta$ of the alloys of the system Fe-Cr, since a fundamental change in the structure of the crystal lattice and the physical properties take place along with this transformation. The authors assume these transformations to be related to a change of the energy state of the electrons of the atoms in individual alloy components. Investigations of the changes of the X-ray spectral lines, especially the transition of electrons from the outer energy field to the K-level, are to supply the fundaments for the understanding of the mechanism of phase transformation and of the changes in physical properties. Mention is made of investigations carried out by Kazantsev (Refs 1 and 2), which were not altogether successful

because of unsuitable experimental arrangements. The preparation of samples and their treatment are described, and the K-lines of pure iron and pure chromium, taken in two microphotograms at 1000°C, are shown. The computed values of the width of the K-band of chromium and iron in various alloy compositions at a temperature of 1000°C are shown in table 2, and the computed values of the Fermi energies and of the energies of the 3d band are given, taking into account the α , σ and γ phases. Both tables are discussed in detail, and a diagram (Fig 3) is plotted with the respective data, depicting the superimpositions of the energy fields of chromium and iron in Fe-Cr alloys. It is shown in this connection that in the mean range of the concentration of both components the energy of the 3d band of iron exhibits a minimum, and that of chromium a maximum. There are 3 figures, 4 tables, and 3 Soviet references.

Prepared by Academy of SSSR. Institute metallurgii sem. A. A. Borovsk. <i>Mechanics</i> devoted to problems thermophysical splatov.	
Editorial Board: I. P. Baratov (Responsible), Academician G. V. Mordov'ev, V. V. Ogorodnikov, Corresponding Member Academy of Sciences USSR (Secretary Ed.), L. A. Orlitskii, I. M. Rostov, and I. F. Tsvetin. Institute of Technical Education, M. V. Volzhskii Institute of Metal Physics, V. A. Klykov (Tech. Ed.), G. P. Tikhonov.	
PURPOSE: This book is intended for research workers in the field of physics of metals and for metallurgists, particularly those working on heat-resistant alloys.	
CONTENTS: This collection of 45 articles deals with various problems in the production of heat-resistant alloys. Special attention is paid to the mechanisms of deformation of such metals as aluminum, copper, iron, and nickel. Various defects and failures of metals are analyzed, and means for increasing the heat resistance and plasticity are described. Among the physical problems solved are the mobility of atoms in single-phase alloys, depending upon the degree of their crystalline structure; the kinetics of change in liquid phases; the reversible thermal transformation of solid bodies, etc. No personal references follow each article.

B006/B017*24.6.200*AUTHORS: Borisov, N. D., Nemoshkalenko, V. V.TITLE: On the Problem of Determining the Energy of X-Ray
Photons and the Energy of Atomic Electron LevelsPERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1960,
Vol. 24, No. 4, pp. 393-396

TEXT: The present article is a reproduction of a lecture delivered at the 4th All-Union Conference on X-Ray Spectroscopy (Rostov-na-Donu, June 29 - July 6, 1959). Above all, the authors point out that a number of tables on X-ray spectra available at present are incorrect because they do not take into account the relation $\lambda kX = 1.00203$ (e.g., Refs. 2-6) although they have been issued after 1947. The deviations are illustrated by some examples. The table on p. 393 contains the λ -values in X-units for the $K\alpha_1$ lines of some elements, the tabulated energy values in rydbergs, and the energy values computed from the formula $E = 1/\lambda R$ (R = Rydberg constant). In determining the photon energy an error occurs (ΔE), which is the higher the higher the photon energy E . The correct ✓

On the Problem of Determining the Energy of X-Ray S/048/60/024/04/05/009
Photons and the Energy of Atomic Electron Levels B006/B017

formula for computing these energies is $\log E(\text{Ry}) = 5.9587650 - \log \lambda$ (X-units) and not $\log E(\text{Ry}) = 5.9596457 - \log \lambda$ (X-units). In the following, details are chosen from some papers mentioned - e.g., details on the K-level of copper (Refs. 4, 8) - and it is demonstrated that the deviations may be partly very high. The conclusions to be drawn from the investigations of the authors are summarized as follows: 1) The data on X-ray photons and spectral absorption edges given in the tables available at present should be revised with special regard to the most recent data on physical constants. 2) It was found necessary to recalculate the electron level terms, using the state of the neutral atom as zero point of the energy scale. 3) It is necessary for X-ray spectroscopy to set up new tables which take into account the facts discussed by the authors. There are 1 table and 14 references: 7 Soviet, 3 American, 1 British, 1 Czech, 1 German, and 1 Swedish.

TOPIC TAGS: temperature instrument, oceanographic instrument

ABSTRACT: The stability of bathythermographs and the effectiveness of correcting the recorded data by field verification are studied. The repeatability of measurements of the temperature unit of the instrument was studied at the laboratories of institutes, at a plant laboratory, and on expeditions. The scale errors of the temperature unit are discussed. Observations of the consistency of the range of variation of corrections confirmed the conclusion that the magnitude of this range, which is a measure of the linearity of the temperature unit scale, does not have a tendency to increase with time and is a rather stable quantity. The author also dwells on the problem of the consistency of the instrument which is solved by a systematic series of trials at selected points of the scale by a subsequent comparison of

Card 1/2

UDC: 551.460.18

L 38924-66

ACC NR: AT6016357

the corrections in a chronological series. The chronological series of scale corrections are shown in tables, the corrections being derived in the laboratory, before an expedition, during an expedition, and again in the laboratory. A 0.3° allowance for over-correction was used as a criterion in estimating the consistency of the corrections. Neither tested instruments had consistency since the change of corrections exceeded 0.3° . The conclusions with respect to Soviet bathythermographs partially coincide with those of T. M. Dauphinee and H. Preston-Thomas (The Measurement of Ocean Temperatures. Temperature, Its Measurement and Control in Science and Industry. New York, 1962) with respect to foreign bathythermographs, i.e., bathythermographs have a number of limitations. However, the author does not agree that disturbance of the consistency of the instrument is explained by rough handling. Nevertheless the author recognizes the fact that consistency is lost when the instrument is used on expeditions where the instrument undergoes light joltings, for example against the side of the ship. Orig. art. has: 9 tables and 2 formulas.

TITLE: Organization of Technical Field Service for Road-Making Machines

PERIODICAL: Mekhanizatsiya stroitel'stva, 1959, Nr 10, pp 12-16 (USSR)

ABSTRACT: One of the great problems in repairing internal combustion engines of road machinery under field conditions is the special care that needs to be given to the fuel feeding apparatus, such as carburetors and fuel distributing devices. The Mechanization Department of the Odessa Sovmarkhoz has developed a field service center intended to repair and to service carburetor gas engines and Diesel engines in regard to fuel feeding apparatus and systems. The functions of this center consist in maintenance, adjustments, tuning in and regulating fuel consumption, replacing worn parts and training personnel in basic maintenance work. The article gives a list of standard operations included in regular maintenance of fuel feeding systems. These operations are carried out with the aid of sets of special tools and equipment recommended by Professor A.I. Selivanov for Diesel fuel feeding apparatus and by VNIIAT for carburetor maintenance and repair. The article describes in detail a few standard operations with the aid of the said tools and equipment.

Organization of Technical Field Service for Road-Making Machines

Being a mobile service center which travels from site to site, the whole outfit is conveniently arranged in a special trailer which is pulled by a truck or a tractor. The article gives an illustration and description of the interior of the trailer accomodating the equipment. There are 2 diagrams.
